

COMPUTER SYSTEM AND METHOD WITH MEMORY COPY COMMAND

5 ABSTRACT

 A computer system is provided including a processor, a memory (such
as RAM) having a plurality of locations for storing data, and a controller. A
data communications facility (such as a bus) interconnects the processor and
the controller, while the controller is in turn coupled to the memory. The
10 controller is responsive to a single command received from the processor to
copy data from a first memory location to a second memory location, as
specified within the command. By copying data in this manner, processor and
bus bandwidth can be preserved.
